ASX Code – LIN

DRILLING UPDATE AT DINGUIRAYE PLATINUM —NICKEL PROJECT

Lindian Resources Limited (ASX: LIN) ("Lindian" or the "Company") advises that the RC drill programme that commenced on the 28th of October has been completed. The drill programme was designed to test the extensive Pt-Ni soil geochemical anomalism associated with the Dinguiraye intrusive.

A total of 4 RC traverses consisting of 27 holes totalling 1,876m have been drilled. Three traverses were completed across the 7km long Pt-Ni soil geochemical anomaly in Block 2 and one traverse across the Pt anomaly in Block 3. The holes were spaced at 50m intervals on the upslope portion of the soil anomalies and 100m on the downslope. All holes have ended in rocks of ultramafic affinity after passing through a well developed regolith. Potential exists for the occurrence of Pt mineralisation in both the regolith and underlying ultramafics. The occurrence of such Pt mineralisation will only be known upon receipt of assay results.

Due to unseasonally heavy rains that have extended well into the normal dry season the planned drill sites on the Block 1 anomalies were not accessible and this part of the drilling programme has been postponed to 2010.

Export permits have been received for the initial batch of samples and they will be sent to the Intertek laboratory in Tarkwa, Ghana for sample preparation prior to dispatch to the Genalysis Laboratory in Perth, Australia for analysis. It is hoped to have the results of the initial batch of samples by mid to late December 2009.
